Introduction

Background & Purpose

The hospitals in New Brunswick are, on an individual basis, reasonably effective and efficient, having been developed over the years by many knowledgeable and dedicated personnel. Nevertheless, like elsewhere in Canada, development has been somewhat ad hoc and this has resulted in a number of situations of inappropriate service distribution and limited coordination, and some instances of unnecessary duplication. A truly integrated hospital system has yet to be established.

Although the services available within the Province are also generally of an acceptable standard, improved distribution and access are required, as well as some rationalization of existing services in order to achieve a coordinated, complementary network that makes the best use of available resources. This can only be accomplished through a structured plan that defines the specific roles of region hospital corporations and their component facilities within the overall system, distributes services as equitably as is clinically and operationally feasible, and recognizes the special linguistic needs of the Province's population.

The intention of this Master Plan is not to limit the development of the hospital system, but rather to ensure that in the future it evolves in an organized and equitable fashion, while also helping to ensure the optimum use of all available resources. Improved coordination and balance are key objectives of the Plan.

The Plan will also serve as a basic reference point in determining funding priorities for the hospital system at both the Departmental and individual hospital levels.

While the Master Plan establishes objectives for service development in relation to each region hospital corporation, it does not set priorities or a specific timeframe for achieving them. These will continue to be dependent on the availability of resources, including the necessary medical specialists, as well as the funds for other professionals, support staff, supplies, equipment, new construction, and renovations. However, the Department recognizes the importance of working with individual region hospital corporations in relation to the development of programs that are included in their role definitions.

Interpretation & Application

The Plan should be considered a guide to ensure that the service priorities established by individual hospitals are within the role identified for them as a component of the overall hospital system in the Province.

This document has a very broad influence on all Department of Health and Community Services planning, programming and budgeting touching the hospital system. All region hospital corporations should be aware that requests presented to the Department for new or enriched programming are always evaluated for their congruence with the Master Plan. In turn, the Department ensures that all resulting requests for funds by the Department to central government agencies are in accordance with the Master Plan.

The text of the Plan focuses on direct patient services. The normal support and plant services are excluded in order not to unnecessarily complicate the individual region hospital corporation and facility role profiles. Both medical and non-medical education and training have also been excluded on this basis, with patient education programs only being listed in a general way.

This document is further intended to be used as a planning guide in conjunction with "Hospital Standards" and medical manpower guidelines.

Plan Evolution

It is recognized that the Master Plan will have to be adjusted from time to time to reflect population, service volume and casemix changes as well as developments in diagnostic and treatment methods and technologies. To this end, the Plan is reviewed every three years, and recommendations are made to the Minister on changes necessary to update the Plan. Any request from an individual region hospital corporation to the Department that involves a significant modification to its defined service package or role will require similar assessment and recommendation.

It is not intended that the Master Plan will ever become a static document; to remain useful, it must change to meet changed needs and capabilities. It is a principal tool for system-wide, long-term health strategy at the provincial level. Given this context, there will never be a "final version" of the Master Plan. It will evolve over time so as to maintain its value as a development tool.

Service Categories - Hospital System

For Plan purposes, the hospital system is divided into four general categories, distributed to allow the system to be as equitable as is clinically and financially feasible.

Primary Care

Consists of basic curative care (including simple diagnostic procedures and treatment, as well as the referral of more complex cases to a facility rendering a more sophisticated level of care), rehabilitative care, extended care (15 % of acute bed complement), preventive care, and essential health education required at the point of entry to the system or during a patient's hospitalization.

Secondary Care

Consists of specialized care requiring more sophisticated and complicated diagnostic procedures and treatment than is provided at the primary care level. For the most part this level of care will be found in larger facilities and to a limited extent in smaller facilities where officially approved and justified by the population served. Examples: General Internal Medicine and General Surgery, Anaesthesia, General Rehabilitation with full complement of rehabilitation services.

Elevated Secondary Care

Consists of specific specialized care requiring sophisticated and complicated diagnostic procedures and treatment which will be found only in the largest facilities where adequate population and the special human and technical resources are available to ensure program viability. Examples: Pulmonary and Vascular Surgery, Plastic Surgery, Nuclear Medicine, Special Rehabilitation, Geriatrics (with dedicated Extended Care beds).

Tertiary Care

Consists of highly specialized care, or unusually expensive treatment or diagnostic modalities. The decision to offer a tertiary service in the Province, and its subsequent placement in one or more of our institutions is a matter of Provincial health strategy. Such decisions nearly always require extensive feasibility study and explicit government commitment. Tertiary services will be found only in a few designated centres, which will be responsible to provide these services when necessary for a large portion of the population of the Province. Examples: Radiotherapy, Neurosurgery, Hemodialysis, Neonatal Intensive Care, Cardiac Surgery.

Since both elevated secondary and tertiary care usually serve the needs of large parts of the Province's population, the need for service in both official languages will be given particular consideration in their placement and development.

Modes & Levels of Service Delivery - Hospital System

Any of the service categories noted above may be delivered, where feasible, on an in-patient, day care, out-patient, or extra-hospital basis. The modes of service delivery should be determined by their clinical effectiveness and the resources available. Substitution of ambulatory service for in-patient service is encouraged where feasible. The appropriateness of providing extra-hospital service is a difficult assessment and must always be made in consultation with the Department.

Care in the four categories described will be delivered when approved at one of the service levels defined in "Hospital Standards", a joint Department/New Brunswick Hospital Association project, which prescribes the resources considered necessary and achievable to operate at each service level.

Organization of the Hospital System

A major re-organization of the hospital system took place in 1992. The former hierarchical network of thirty-two Community, District, Regional and Specialty Hospitals, and Health Service Centres was replaced by eight Region Hospital Corporations. These corporations manage all hospital facilities within a defined geographic area as a unified organization operating on multiple sites. The geographic area corresponds to the boundaries of the Health Regions, in use for many years for health planning purposes.

A number of benefits are expected to flow from this re-organization. With the direct access to and authority over an integrated mix of all facility levels provided by this form of organization, establishing a rational continuum of care within the region boundaries should be much easier. Duplicate services provided to the same population should be able to be rationalized optimally without the complications of inter-institutional competition. The Master Plan provides some intermediate term targets for each region hospital corporation in this respect.

Mental Health Commission

In 1990, all mental health concerns formerly administered through various branches of the Department were integrated organizationally so far as possible and placed under the jurisdiction of the Mental Health Commission. This included the Province's two psychiatric hospitals. While the Commission now has operational responsibility for these hospitals, it is responsible to the Minister of Health and Community Services, and strives with the Department to ensure that short and long-range planning for these institutions is compatible with the rest of the hospital system.

Provincial Overview

The Province is divided into seven health regions. These regional boundaries are shown in Appendix "A".

Although it is impractical to plan for each region to be completely self-sufficient beyond the secondary level, each region hospital corporation should have a network within its boundaries that will allow the referral of patients to the care level required if available within that region. This network will extend beyond the region to elsewhere in the Province, if the services required are not available in that region or when the patient chooses to seek services beyond his or her own region.

Further, this network will extend beyond the boundaries of the Province when special services are required which are not available or reasonably accessible within the Province.

Regional Overview

In most regions, there will be a network of facilities which will include a large facility and one or more smaller facilities, depending on geographic size and population distribution. These latter facilities will be responsible for

delivering primary services and some secondary services depending on the size of the immediate population served, geographic distance from the larger facility, and the linguistic composition of the region.

Inter-facility Relationships

It is expected that for the most part, primary services required by a patient will be obtained at the facility closest to that patient's residence, regardless of size. Most secondary services will normally be available to the residents of a region through the largest facility. However, a few such secondary services will be approved and available through smaller facilities where distance from the larger facility, clinical feasibility, and other factors justify this approach.

As previously noted, elevated secondary and tertiary services will only be available in specific facilities where appropriate resources, catchment population, and geographic location justify and support their clinical and economic viability.

Certain tertiary services are not available within the Province. Patients requiring such services will be referred to other provinces when possible or to other jurisdictions when necessary.

Referral networks and on-going communications must be established and maintained with available community services and other hospitals within the system if patients are to reach that point in the overall network which can best address their individual needs. All levels are expected to foster and maintain good working relationships with other facilities in the region to which they refer patients or receive referrals. This is described in "Hospital Standards" as active, formalized relationships with other hospitals in the area as appropriate for communication, education, consultation, referral, transfer and transport. Even though this effectively means internal communications for the most part with the re-organization into the larger region hospital corporations, there is still considerable inter-region referral activity requiring active attention for optimal patient care.

Role Outlines-Individual Hospitals

As prescribed by this overall Master Plan, every region hospital corporation and its component facilities will be an important and integral part of the comprehensive delivery system. In order that this system can provide the most effective and equitable hospital services to all citizens within the resources available, it is imperative that each region hospital corporation plan and operate within its designated role, and as a cooperative component of the overall system.

The following profiles outline the designated role for each region hospital corporation within the Master Plan. These prescribed role outlines should assist individual region hospital corporations to more appropriately plan and operate in the future. (Please note that an "X" beside a service listing in a particular location means only that the Master Plan calls for the service to be offered at that location. The Plan does not imply any particular level of program depth or hours of coverage.)

Region 5 (i) Restigouche County, less the parishes of Grimmer and St.-Quentin

Region 6 (i) Gloucester County

Region 7 (i) Northumberland County, less the parishes Ludlow and Blissfield

APPENDIX "B"

Service Level Descriptions

Service Level Descriptions

The following service level descriptions will serve to clarify the levels of services to be found in specific categories of hospitals within the approved hospital system.

In the case of Medical Services delivered at the Primary care level, these will for the most be delivered or ordered by the General Practice Medicine physicians involved (i.e. medicine, obstetrics, paediatrics).

In the case of Specialty services delivered at the Secondary, Elevated Secondary, and Tertiary care levels, these will be delivered through a structured program directed by a certified specialist of the specialty in question. (i.e. Internal Medicine, Specialty Obstetrics, Specialty Paediatrics, Gynaecology, Urology, Physiatry etc.)

In addition to these general descriptions all approved services should be categorized as to level (A, B, C) utilizing the provincial hospital standards.

Rehabilitation Services:

Not all facilities have all rehabilitation services as part of their Master Plan. Most facilities with in-patient roles, however, do engage in some degree of rehabilitation service. The basic division of rehabilitation services is into General and Special Rehabilitation.

General Rehabilitation means rehabilitation services provided to a recovering short or long term patient, past the most acute or severe stage of illness but still requiring an organized program of physical medicine and general rehabilitation in a facility. With a full complement of rehabilitation services and a physiatrist on staff, some larger facilities can also offer special rehabilitation.

Special Rehabilitation is provided to disabled patients with a complicated physical disability, which may be accompanied by social and/or psychological complications, and requiring rehabilitative team management in a designated regional hospital or a Rehabilitation Centre (Forest Hill Rehabilitation Centre).

Consistent with the Department's Rehabilitation Services Master Plan, the following service levels will apply for rehabilitation services:

Primary - Physiotherapy, Occupational Therapy, Respiratory Therapy

Secondary - Primary services plus Speech/Language Pathology. Where the demand justifies the capital investment required, Audiology will be considered part of the secondary level complement of Rehabilitation Services.

Elevated Secondary - Primary and Secondary services, plus full-time resident Physiatry

In Community hospitals, provision of primary level occupational and respiratory services may be a regular hospital program or on a consultative basis, depending on the patient load.

Elevated secondary services include hospital programs of special rehabilitation under the clinical direction of a physiatrist. Certain other elevated secondary and tertiary clinical services are closely related to special rehabilitation, and either form part of special rehabilitation, or support it. These include Rheumatology, Neurology, Neurosurgery/Neuro ICU, Cardiac Surgery and Reconstructive Surgery.

Day Surgery

Where an individual hospital role statement in this Master Plan specifies Day Surgery (Surgical Day Care, Ambulatory Services), this means:

> Elective minor surgical, dental, therapeutic (chemotherapy, blood transfusion etc.) and diagnostic procedures, (endoscopy, angiography etc.) requiring general anaesthesia (less than 90 minutes) or local anaesthesia, with post operative observation not generally exceeding two hours, and a total expected duration from admission to discharge not exceeding six hours.

Within these limits, each hospital develops its own list of individual procedures with due regard to "Hospital Standards" for Day Surgery, Surgery, and Anaesthesia; and individual practice privileges of Medical staff.

Medical Day Care

This includes non-emergent, non-surgical ambulatory diagnosis and treatment. Examples: chemptherapy, diabetic day care.

APPENDIX "C"

Definitions
Out-Patient Clinics

Definitions - Out-Patient Clinics

The following list of clinics with definitions are those identified in the Plan and which would be operated in a specific hospital on a regular and scheduled basis.

Out-Patient Clinics - These are clinics which are approved by the Board and are operated on a regular and scheduled basis by a specific member or members of the approved medical staff of the hospital in question and which provide services of a type that require the use of sophisticated equipment or the presence of specialized professional support staff not usually available in the doctor's office.

Visiting Specialty Clinics - These are clinics which are approved by the Board and are operated on a regular and scheduled basis by visiting medical specialists who visit the hospital for the purpose of providing consultation services in their medical specialty. These specialists must have a medical staff appointment in the hospital where they attend out-patients.
